Adopting Wolf-Rayet abundances

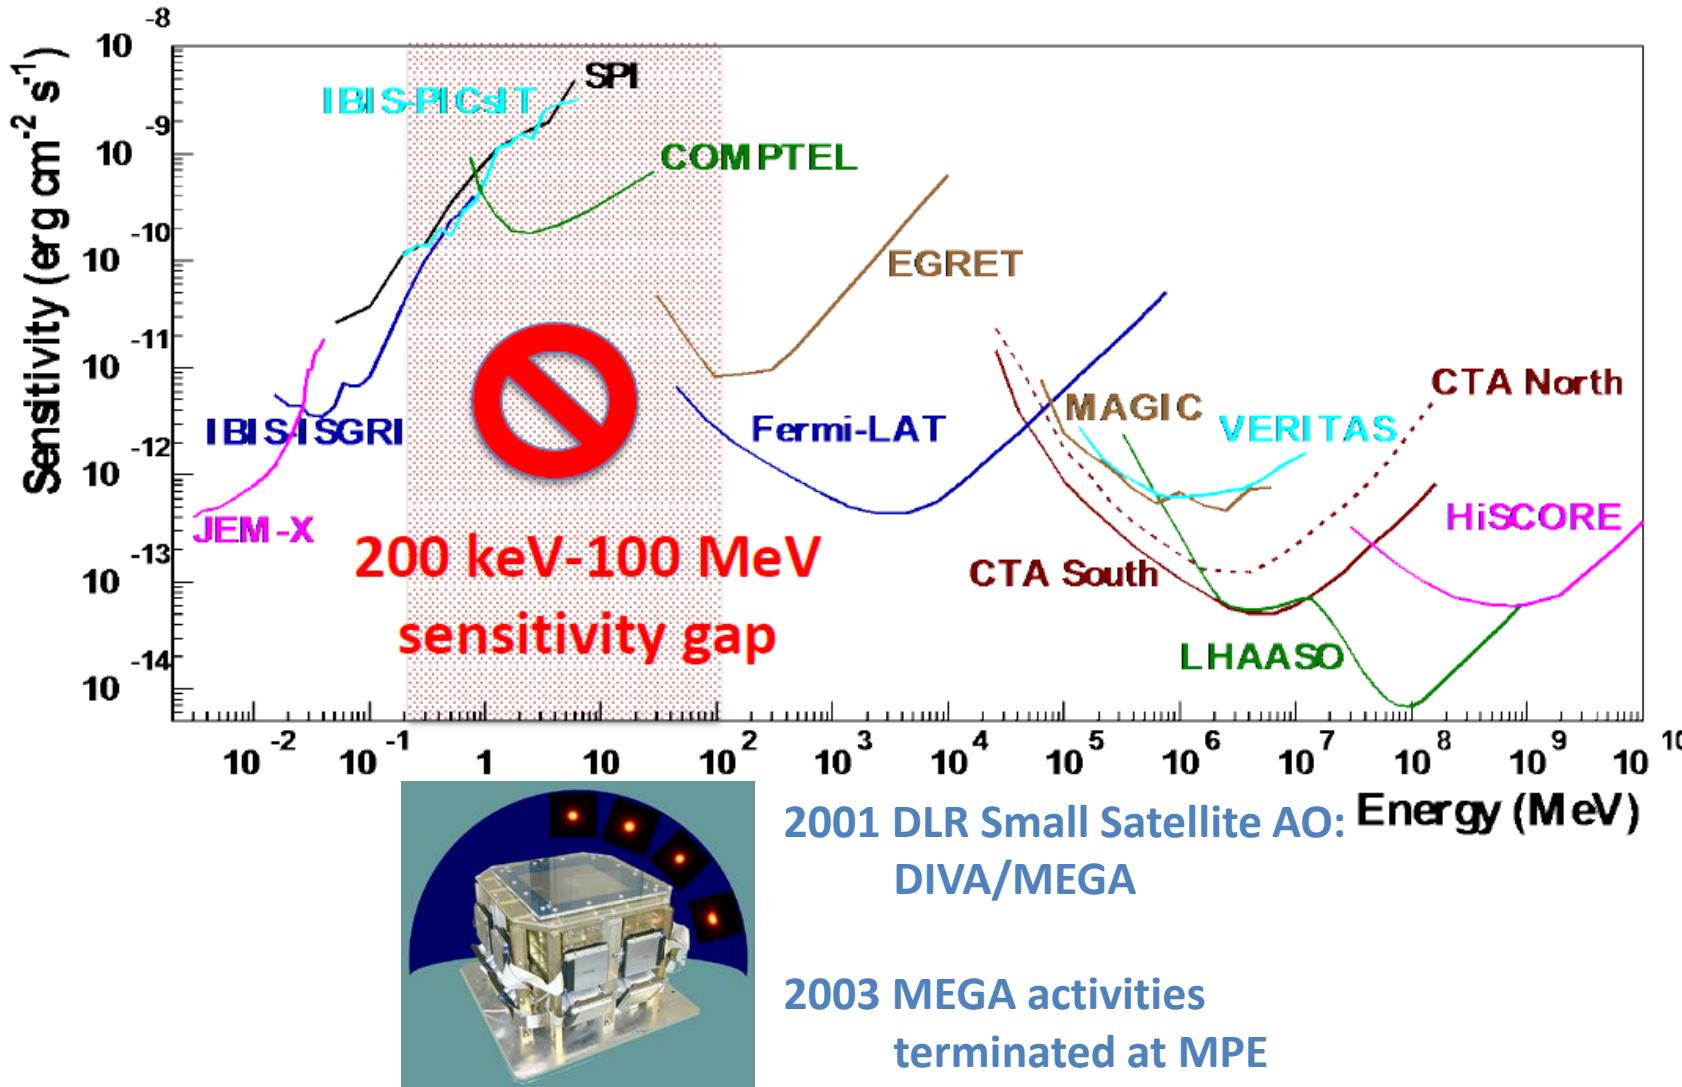

A. Summa et al.: Nuclear de-excitation line spectrum of Cassiopeia A

Nuclear excitations and cosmic rays:

- 1-100 MeV cosmic rays
 - Ionization inside of molecular clouds: The missing link to star formation
 - Activation of chemical reactions on icy dust grains: The cradle of life
 - Chemical composition of cosmic rays and SN ejecta: The injection problem
 - Spallation yields of light element: The Lithium puzzle
 - Secondary positrons: The positronium riddle
- Extragalactic cosmic rays?
 - Need MeV detector at least an order of magnitude better than COMPTEL or INTEGRAL or two orders to catch the nearest AGN...

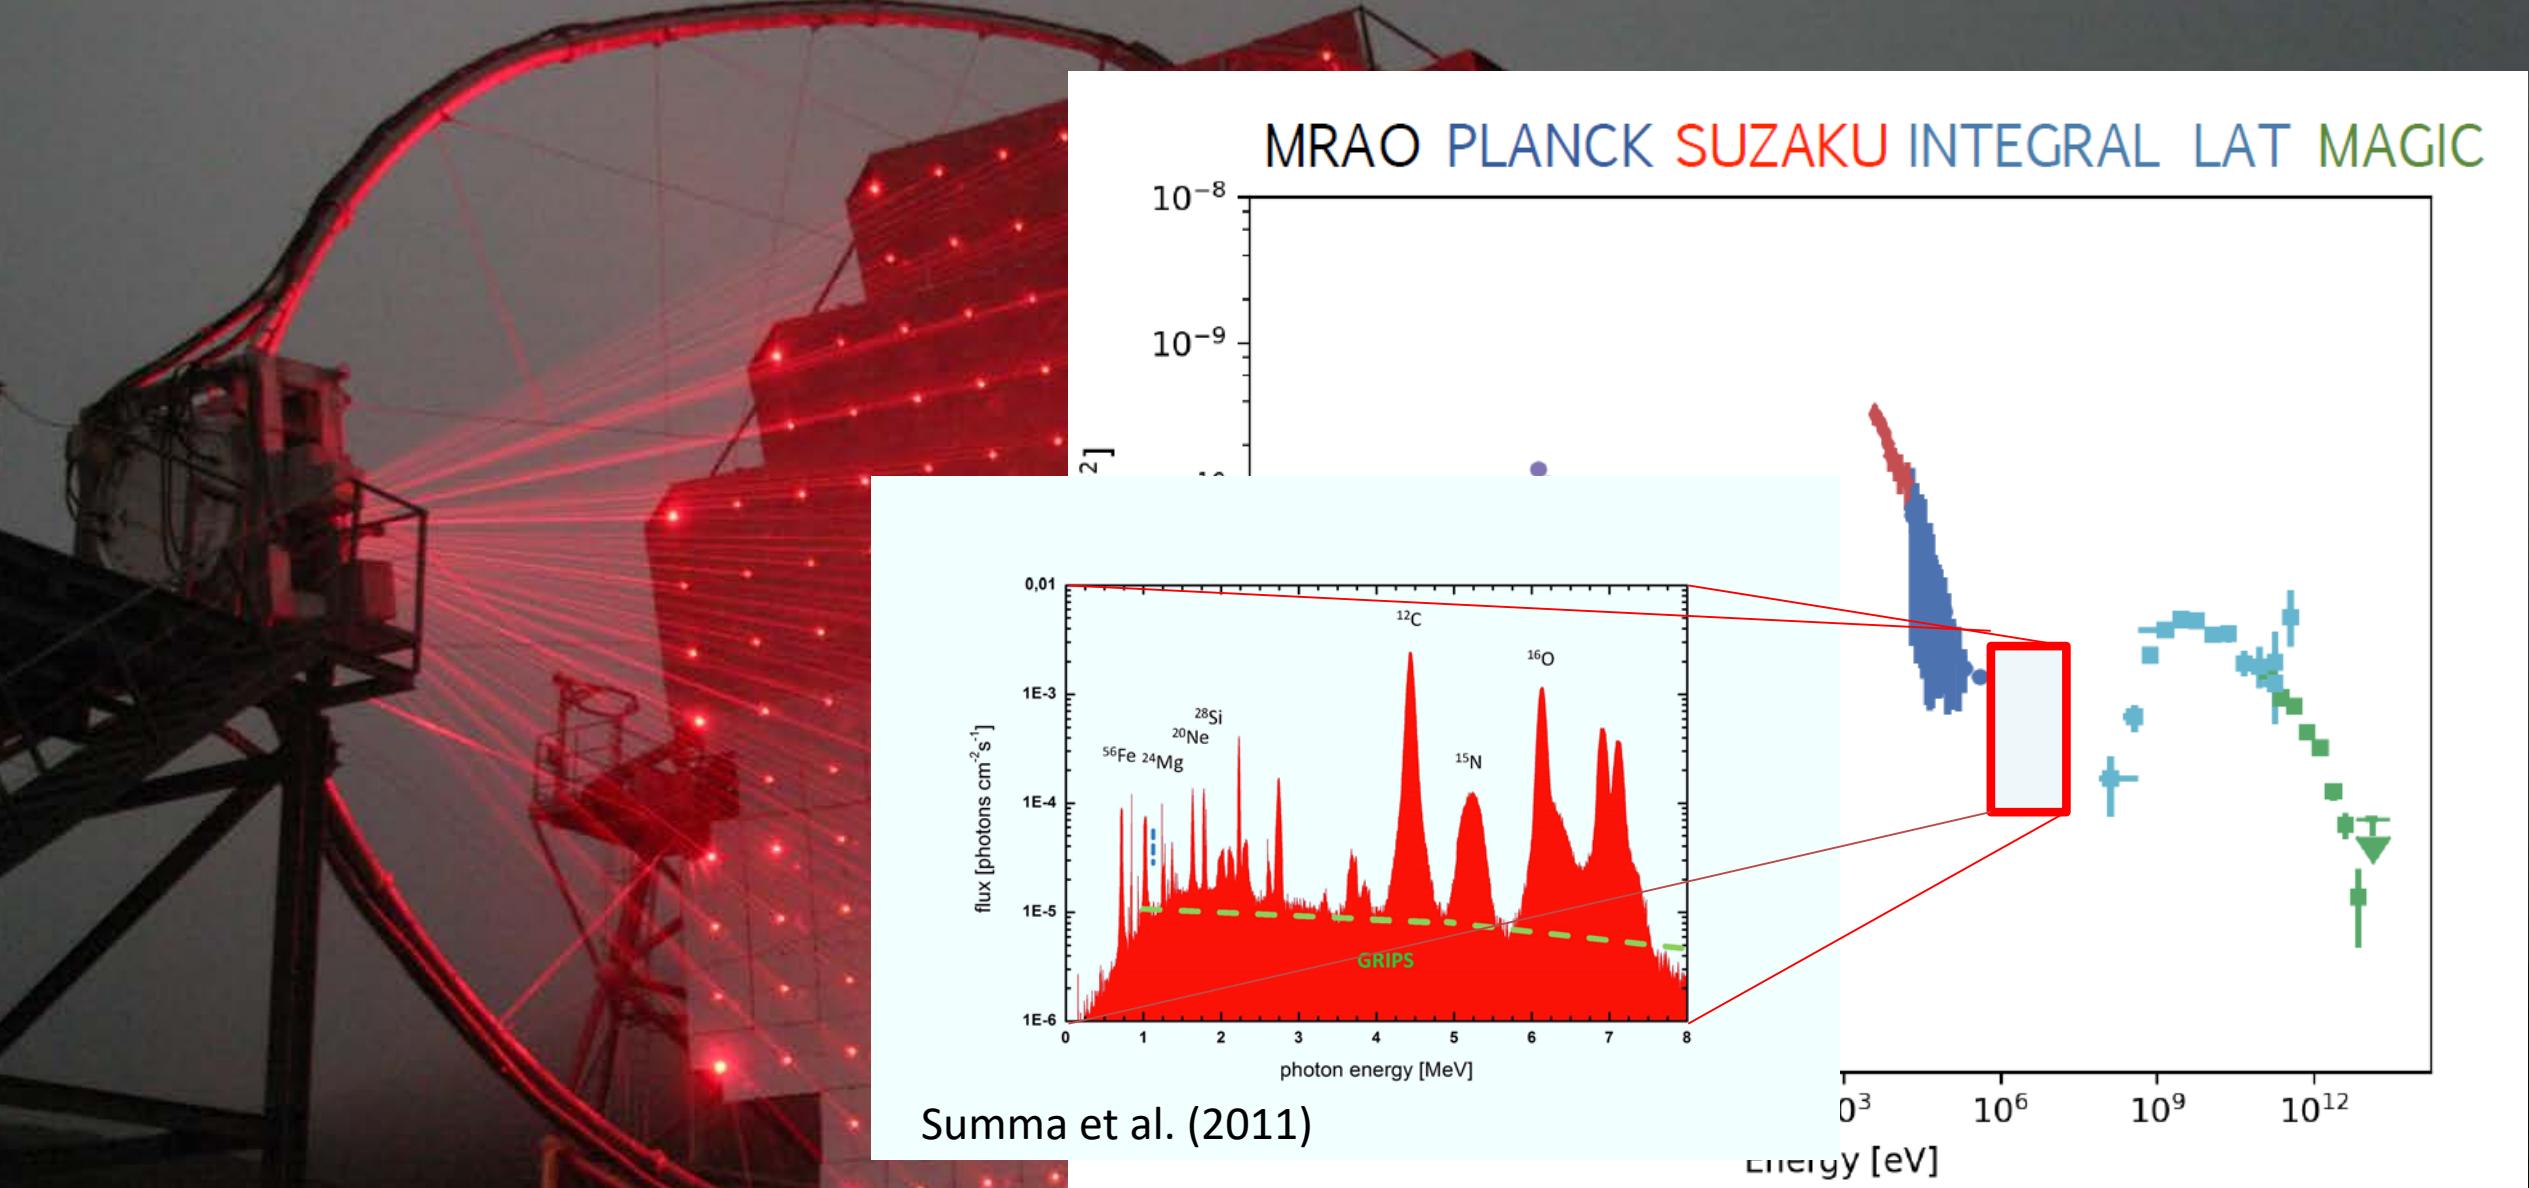

The MeV Gap

“There’s just one thing I can promise you about the outer space program – your tax dollar will go further.”

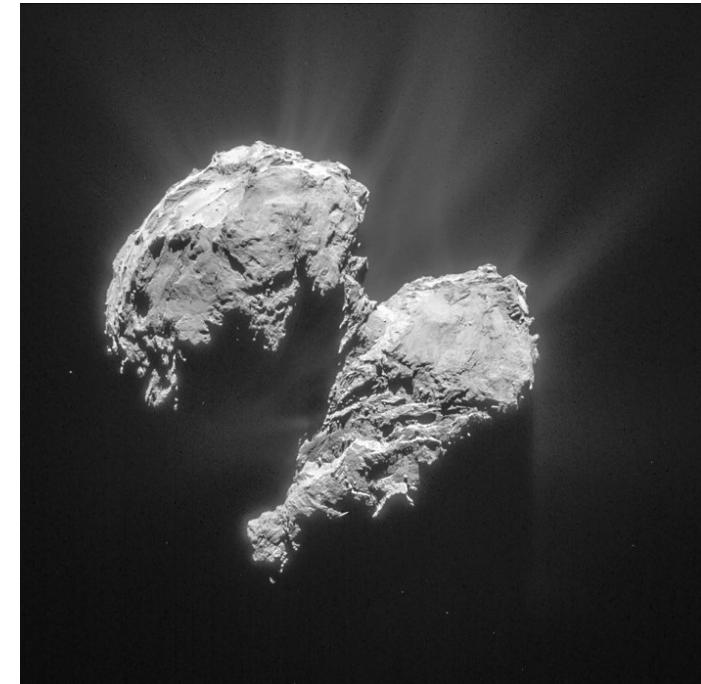

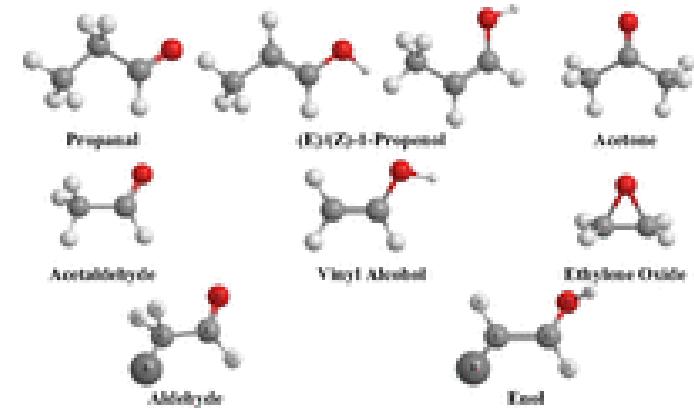

Werner von Braun

Wolf-Rayet SNR Cas A: Nuclear lines as hadronic fingerprint

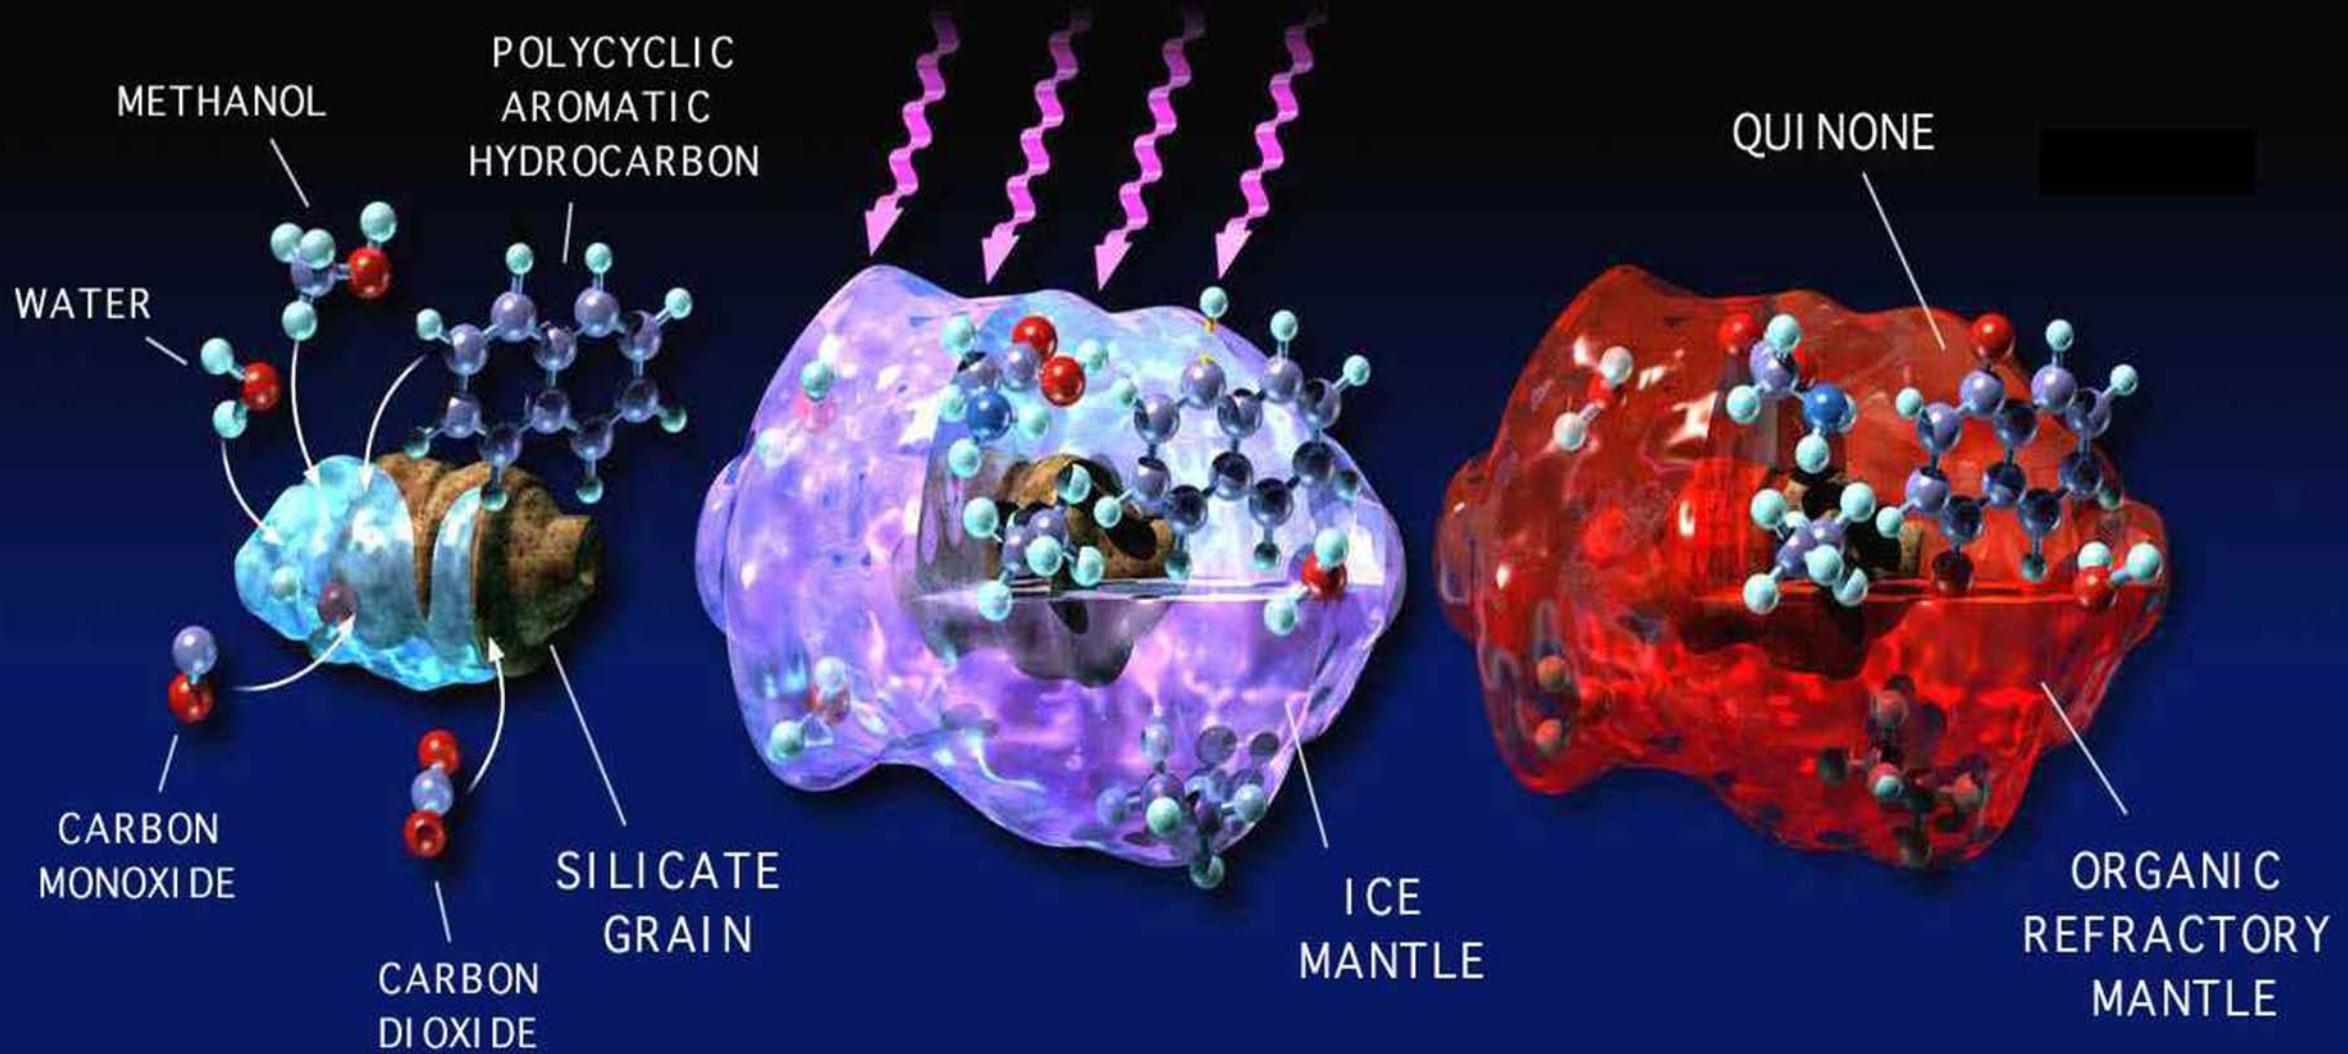

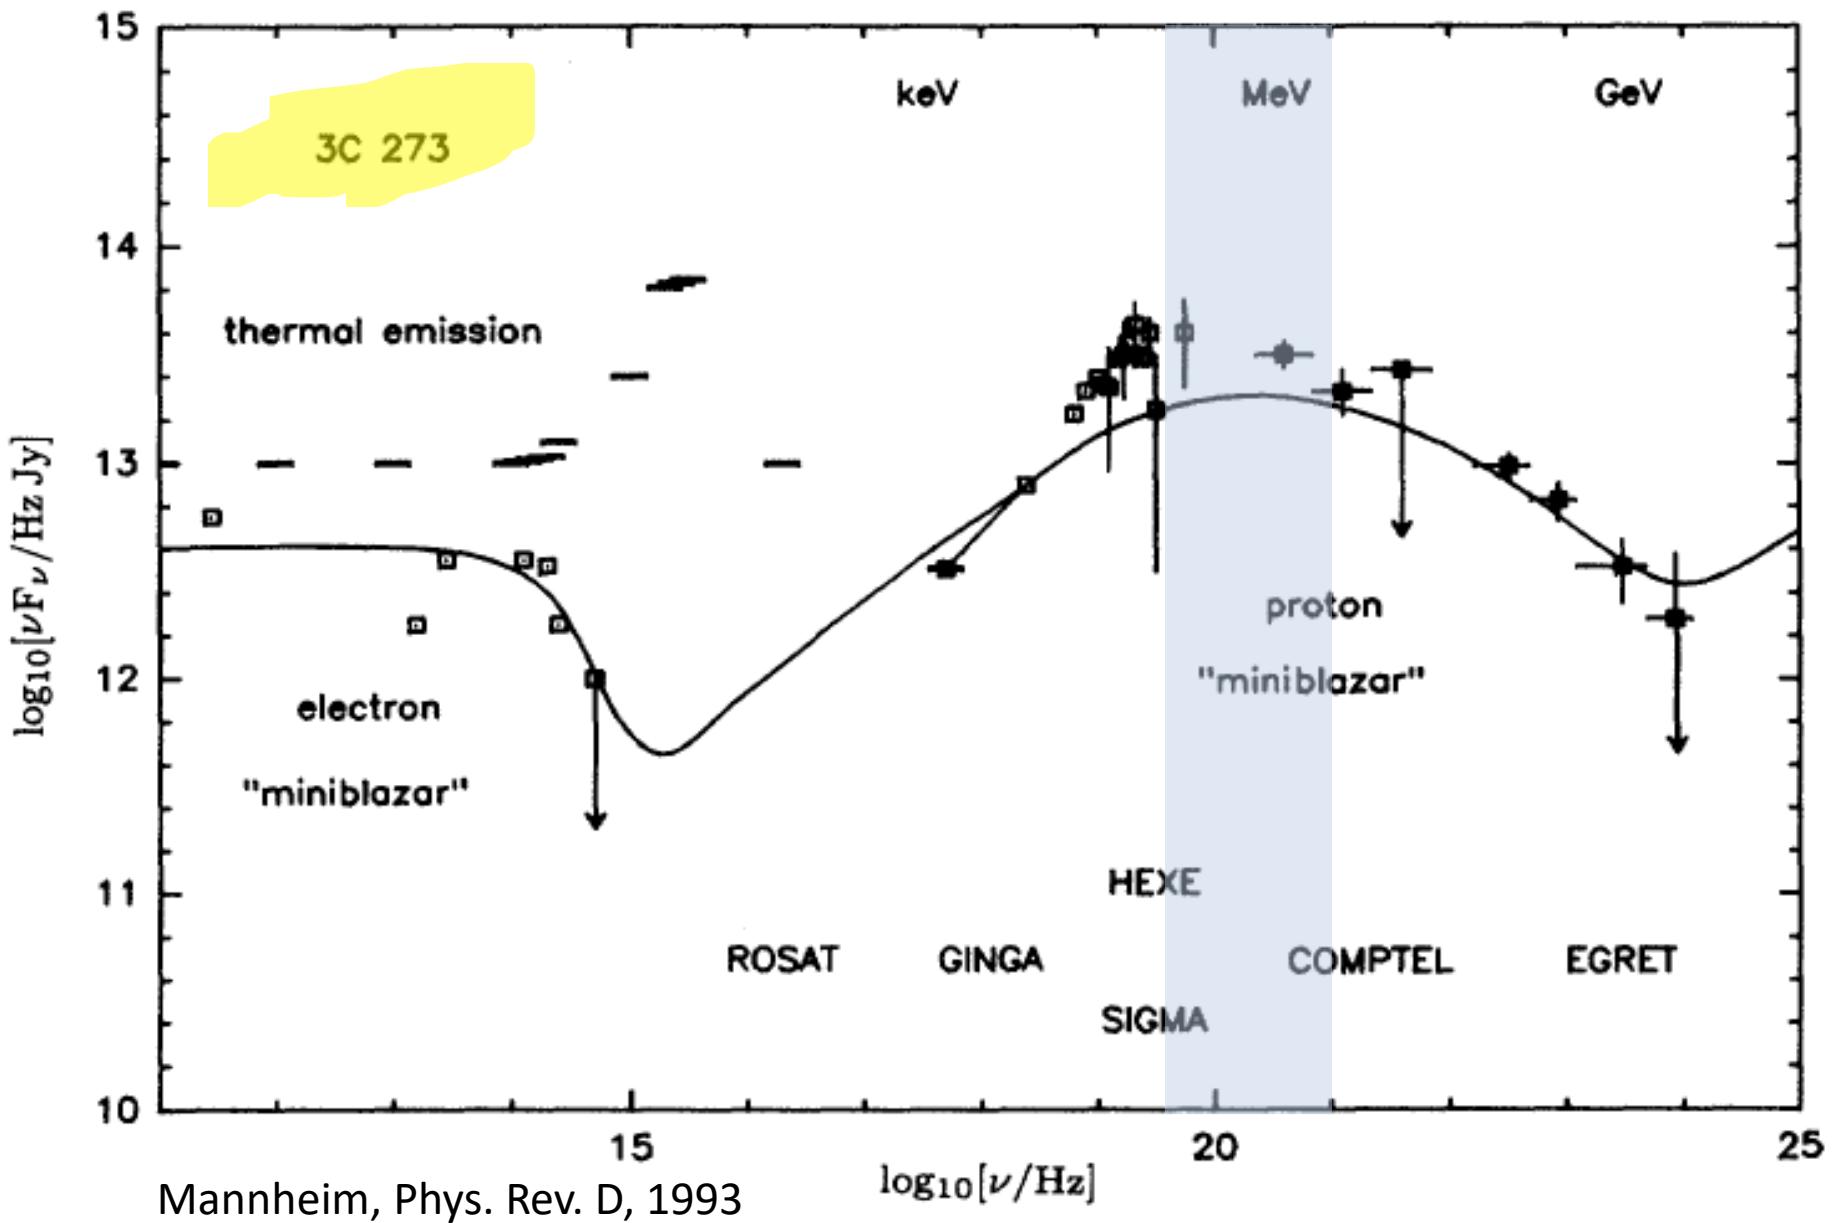

1-100 MeV cosmic rays and the cradle of life: The cold non-equilibrium chemistry in ice

- Interstellar space and in particular molecular clouds are filled with icy grains formed by water sticking on silicate or ferrite cores
- Cosmic rays induce complex molecular reaction networks in these ice grains
- Confirmed in laboratory experiments and simulations (M.J. Abplanalp, PNAS, 2016)
- Rosetta probe contained organic molecules from icy material formed in the Kuiper belt

in Solar Masses

Keep on rolling

A large, dark, and slightly blurry image occupies the bottom half of the collage. It appears to be a landscape scene, possibly a forest floor or a field, with dark green and brown tones. Overlaid on this image is the text "Keep on rolling" in a large, white, cursive font.
