

Beyond 1 m/s : advances in precision Doppler spectroscopy

Guillem Anglada-Escude

Postdoctoral scientist

Georg-August-Universität Göttingen

Institute for Astrophysics

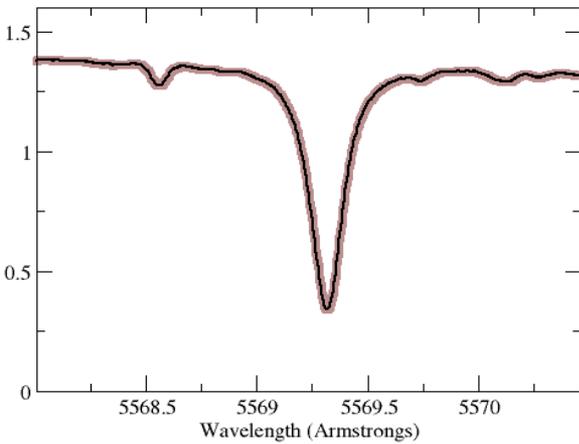

Oct 2012

Ansgar Reiners, Mathias Zechmeister (U. Goettingen)
Paul Butler, Steve Vogt (UCSC-Carnegie)
Mikko Tuomi, Hugh Jones, John Barnes (Hertfordshire Univ.)
James Jenkins (U. Chile)
Enrico Gerlach (TU Dresden)
Peter Plavchan (IPAC)

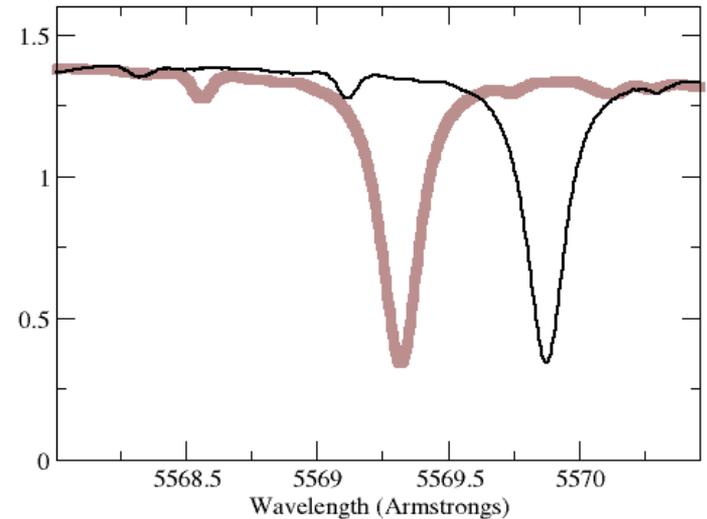

Precision radial velocities

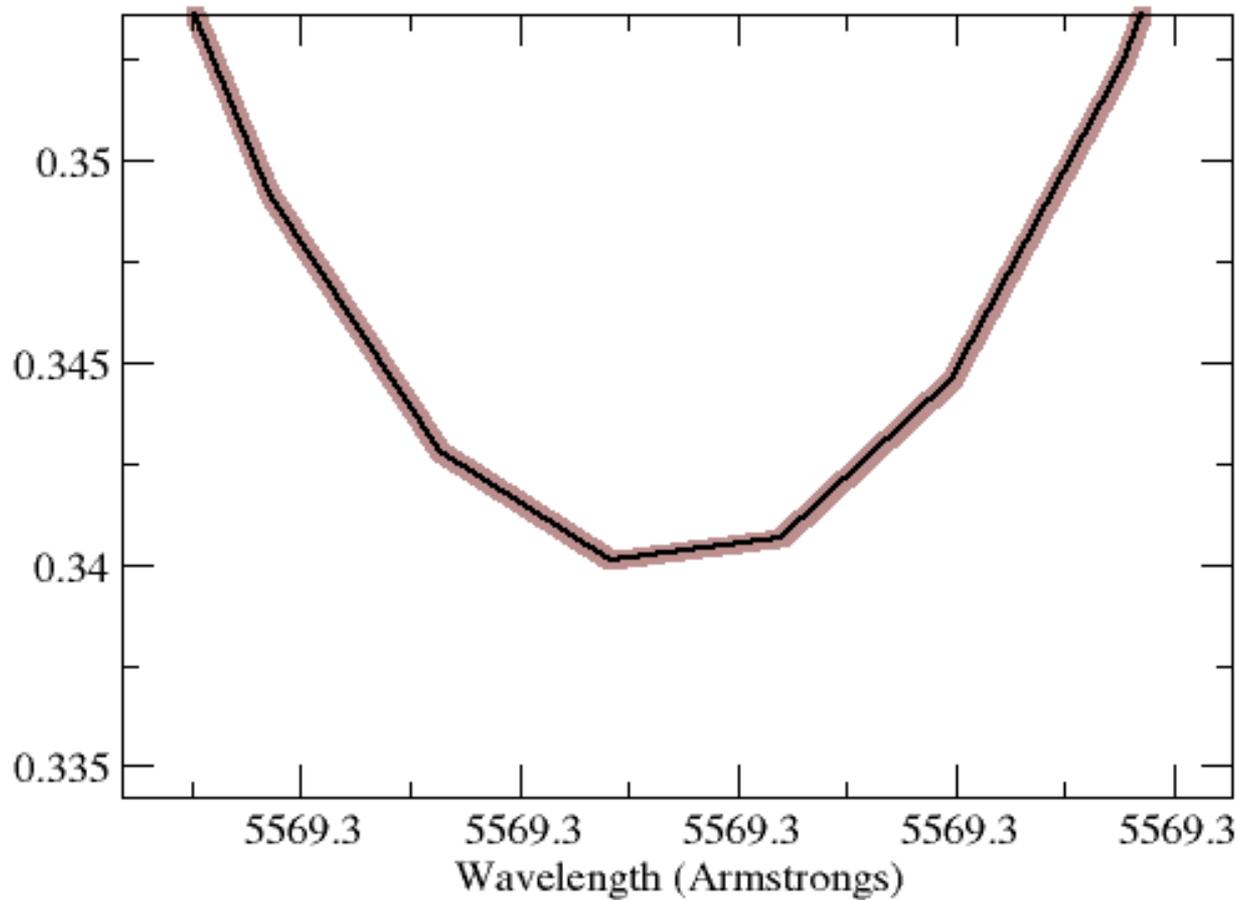

**Width of a typical
solar line is 15 km/
s**

**Spectroscopic
binary
K=30 km/s**

Coming soon?

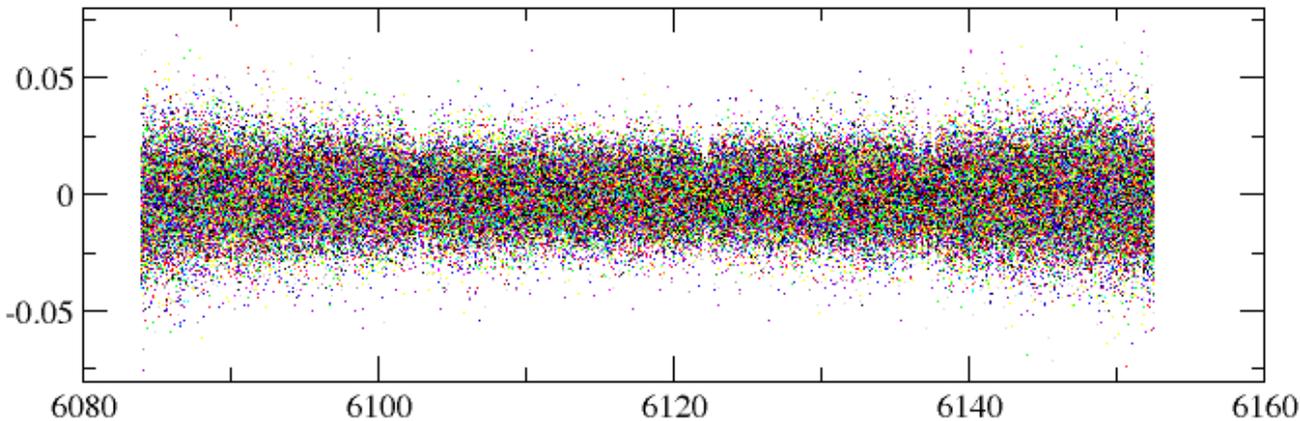

Template methods + Stabilized spectrographs : more than RVs

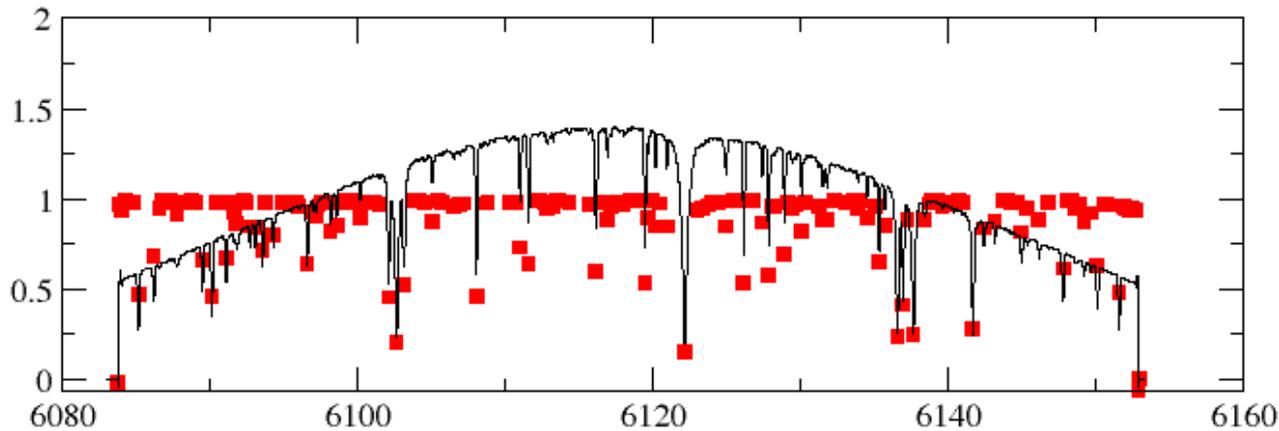

**~40 consecutive
spectra**

Template methods + Stabilized spectrographs : more than RVs

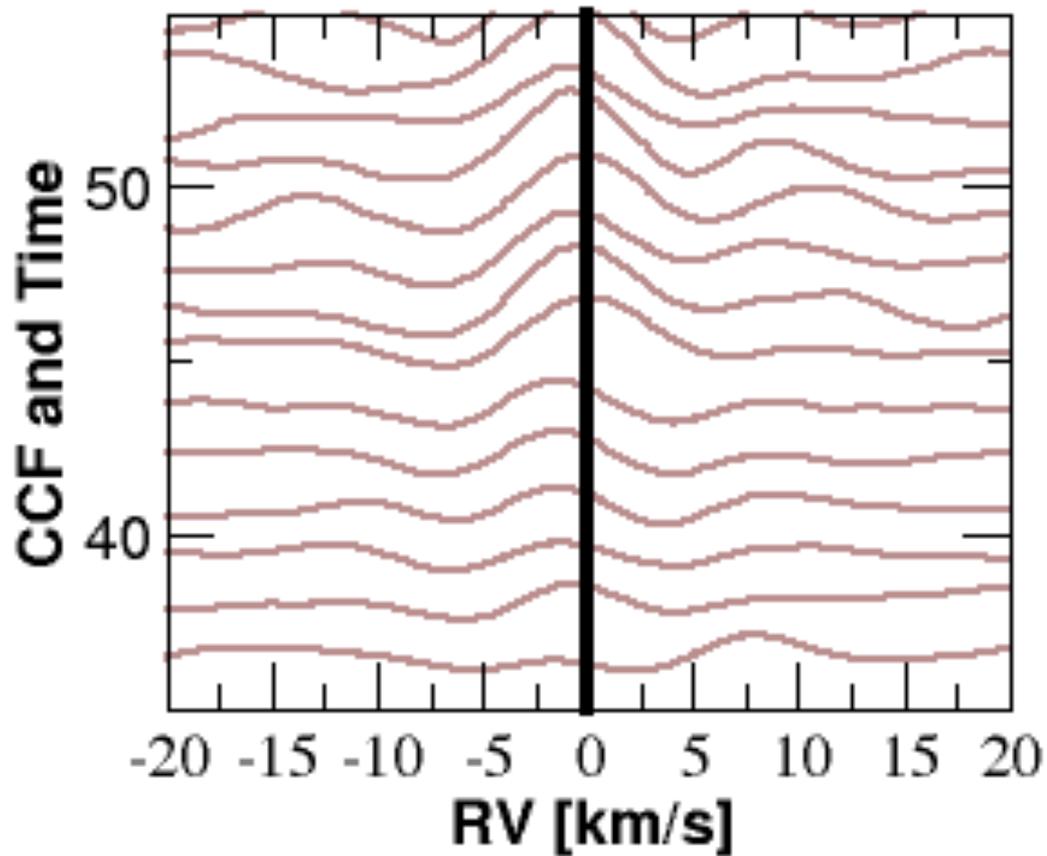

**~50 consecutive
spectra**

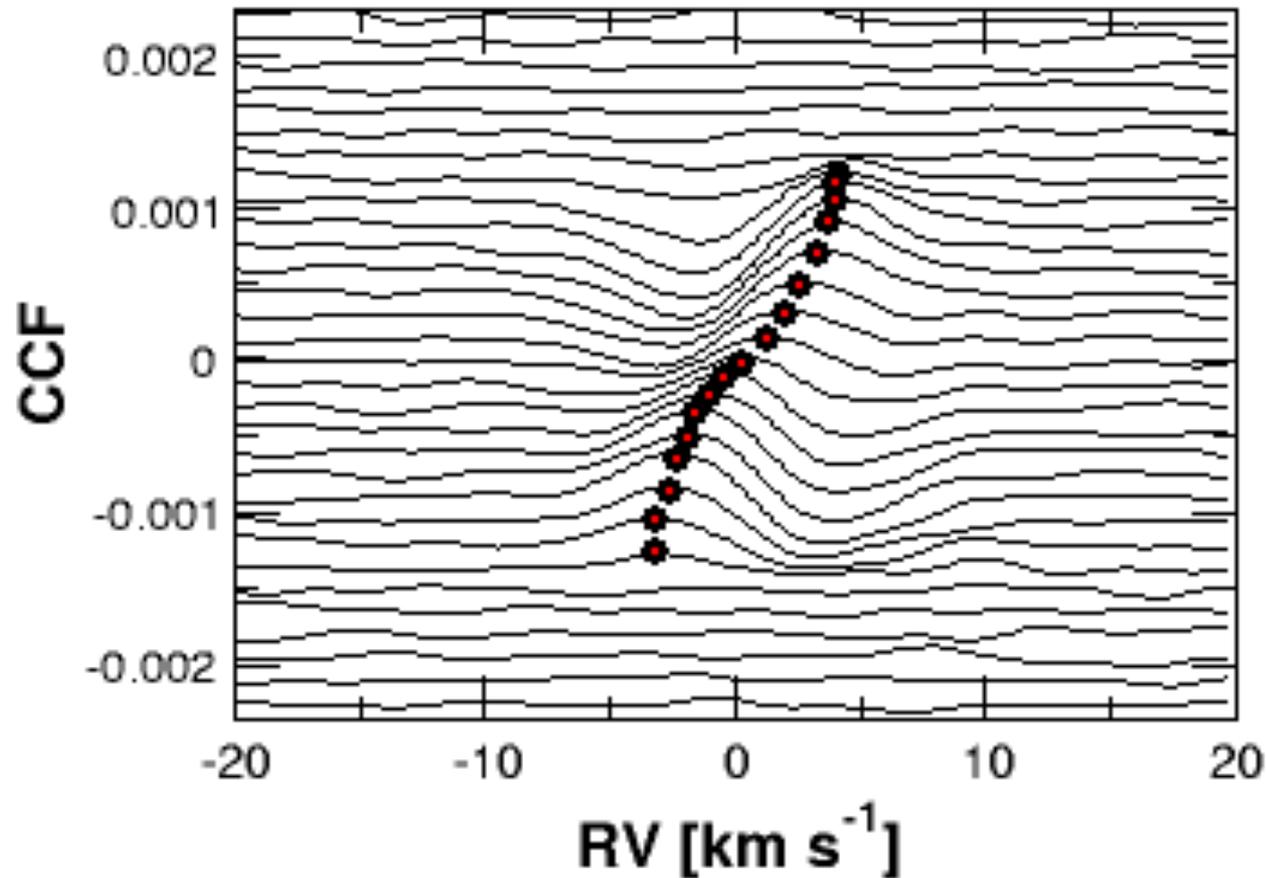

**Mask from
Template**

Template methods + Stabilized spectrographs : more than RVs

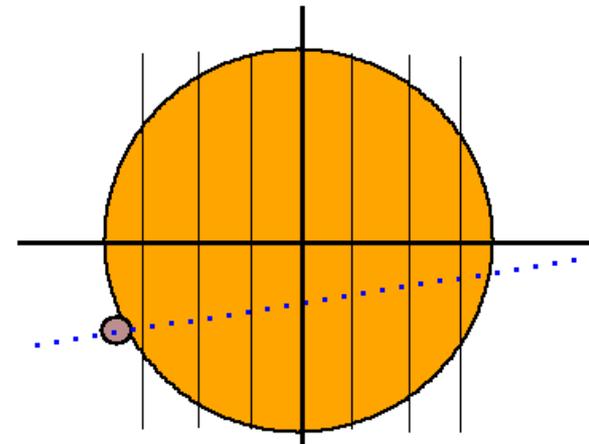

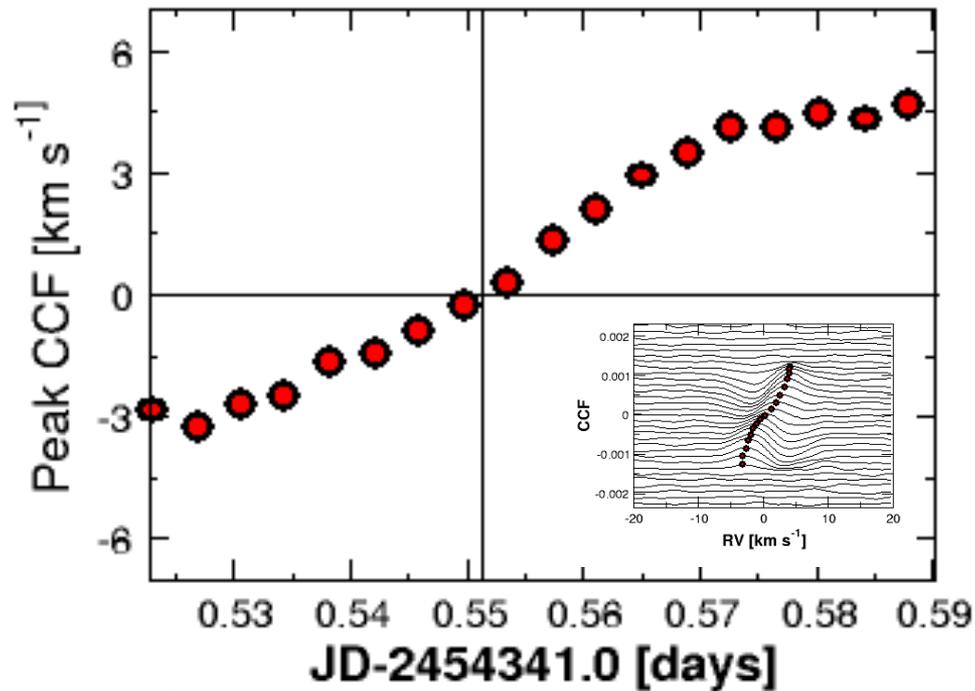

Template methods + Stabilized spectrographs : more than RVs

Same principle as Cameron et al. 2009 PASP, but completely model independent

Template methods + Stabilized spectrographs : more than RVs

Conclusions

The background of the slide features a dark space scene with numerous small white stars. A bright yellow star is visible in the upper left, and a reddish star is in the center. On the right side, the curved edge of a planet, likely Earth, is visible against the blackness of space.

**There is more than 1 Doppler measurement in a spectra
(HARPS : 72 orders x 4096 pix)**

HARPS-TERRA : higher precision on K and M dwarfs

Stabilized spectrographs : tons of information

Observations are not repeatable -> release spectra

PS. I do not believe Alpha Cen Bb is real...

... but I would like to.

There are 'reasonable' doubts about the candidate signal
(see Hatzes, A., Nature News & Views)

To ESO :
**PLEASE release the SPECTRA
of published papers**

Including Alpha Cen B, GJ 581, GJ 667C data, HD 88512, HD 20794, Tau Ceti...

... or at least, respond to e-mails
