## 1 Inverse Compton from Sun and Stars

This document generated on November 12, 2012.

Documentation of software, with examples and derivation of formulae. More information can be found in README and in the driver programme provided. This will also be included here in future.

## 2 Examples

These examples were generated using linear and logarithmic intervals of the angle  $\theta$  from the sun. The graphics were generated with the *idl* commands output at run time.

The profiles show the decrease at the solar limb due to occultation of gamma rays from beyond the sun, and also the effect of the anisotropy of the solar radiation field, which reduces to almost zero the emission between the earth and the sun, due to IC scattering at very small angles. In contrast, the emission at small angles outside the disk includes the head-on scattering from beyond 1 AU, which is maximum. Hence the emission here is dominated by the distant regions.

To make it look like MS2000 equation 8:

$$\frac{dR}{d\epsilon_2} = n(\epsilon_1)c\pi r_e^2 \frac{m_e^2}{\epsilon_1 E_e^2 (1-v)^2} \left[ \left( \frac{m_e}{\epsilon'_1} \right)^2 v^2 - 2 \frac{m_e}{\epsilon'_1} v (1-v) + (1-v)^3 + 1-v \right]$$

$$\frac{dR}{d\epsilon_2} = n(\epsilon_1)c\pi r_e^2 \frac{m_e^2}{\epsilon_1 (E_e - \epsilon_2)^2} \left[ \left( \frac{m_e}{\epsilon'_1} \right)^2 v^2 - 2 \frac{m_e}{\epsilon'_1} v (1-v) + (1-v)^3 + 1-v \right]$$

$$\frac{dR}{d\epsilon_2} = n(\epsilon_1)c\pi r_e^2 \frac{m_e^2}{\epsilon_1 (E_e - \epsilon_2)^2} \left[ \left( \frac{m_e}{\epsilon'_1} \right)^2 v^2 - 2 \frac{m_e}{\epsilon'_1} v (1-v) + 2 - 4v + 3v^2 - v^3 \right]$$

$$\frac{dR}{d\epsilon_2} = n(\epsilon_1)c\pi r_e^2 \frac{m_e^2}{\epsilon_1 (E_e - \epsilon_2)^2} \left[ 2 - 2v \left( \frac{m_e}{\epsilon'_1} + 2 \right) + v^2 \left( \left( \frac{m_e}{\epsilon'_1} \right)^2 + \frac{2m_e}{\epsilon'_1} + 3 \right) - v^3 \right]$$

This is MS2000 form with

$$v = \frac{\epsilon_2}{\gamma m_e}$$

and

$$\zeta = -\eta$$
